About SimaPro

SimaPro is life cycle assessment software that helps organizations measure and analyze the environmental impacts of products across their entire life cycle. Built on extensive datasets and established scientific methods, the software provides transparent insights that support product development, sustainability strategy, and environmental reporting.

Used by industry and academia in more than 90 countries, SimaPro enables advanced modeling and scalable environmental impact calculations across teams. With more than 35 years of development behind it, SimaPro is widely trusted in the global LCA community. SimaPro is part of the One Click LCA group.

1 Introduction

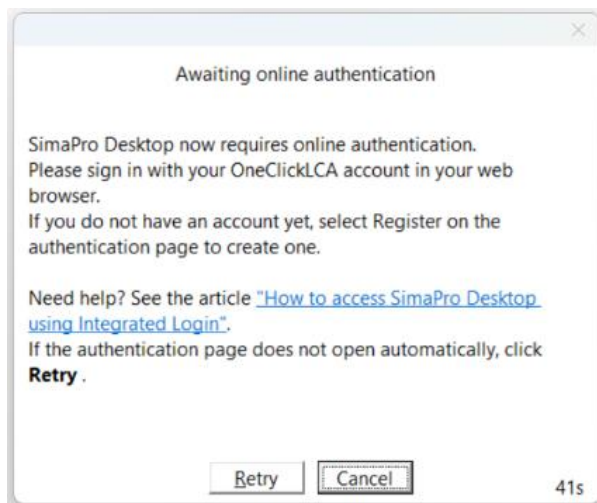

This document describes the changes in SimaPro desktop 10.5 ([formerly known](#) as SimaPro Craft). This release focuses on improving the software performance as well as implementing some bug fixes. On the data side, we implemented some changes to the provisioning of Agri-footprint. We hope you have a smooth experience updating to SimaPro 10.5 and feel free to [reach out to us](#) for feedback and further suggestions.

2 Software updates

2.1 New features and improvements

This release brings a few improvements to enhance your SimaPro experience, including:

- **Improved performance for multi-user**
Multi-user performance has been improved for calculation-intensive operations, helping reduce waiting times when working with larger or more complex models. In addition, further speed optimization was done on opening projects that use multiple libraries.
- **Improved sign-in guidance**
The authentication message shown when starting SimaPro has been enhanced to provide clearer guidance for users on how to access SimaPro using the integrated login. A link referring to the SimaPro Help Center article is provided for step-by-step instructions. Note that you may need to double-click the link for it to open.

2.2 Bug fixes

- Resolved an issue that prompted an error when moving a project to a library.
- Fixed an intermittent issue that could occur when importing databases. In certain situations, particularly on high-performance systems, the import could fail unpredictably. The import process has now been improved to ensure that the database import is completed successfully.

2.3 Known issues

There are a few known issues in the software that we are currently working on:

- **Language support**
Some texts, especially warnings and error messages may not yet be (correctly) translated to the chosen language in SimaPro. The text will be shown in English instead.
- **Cropped texts in languages other than English**
Some texts may appear cropped in certain languages other than English, either within buttons or elsewhere in the interface. We are working on resolving this to ensure all texts are displayed fully. You can try to reduce the font size or adjust your screen resolution as a workaround in the meantime.
- **SimaPro only supports Boolean conditions in combination with multiplication**
Although Boolean conditions can now be combined with multiplication (*), other operators such as addition (+), subtraction (-), and division (/) are not yet supported. We plan to expand this functionality in future updates. In the meantime, you can define each Boolean condition as calculated parameter as a workaround.
- **External link manager doesn't work to reflect renamed Excel fields**
When you link "Outputs to technosphere: products and co-products" field to Excel via "Insert External Link" (only available for Developer/Power user license type) and the Excel file is renamed, updating it via Tools > External link manager doesn't update the stored file path correctly. As a result, SimaPro continues to reference the old location. The workaround would be to update the file path manually. **Note:** this issue only affects Developer/Power user license holders and only occurs specifically in "Outputs to technosphere: products and co-products" field. Other fields are not affected.

3 Data library changes

3.1 Agri-footprint provisioning

The developers of the Agri-footprint database, Mérieux NutriSciences | Blonk, are aligning their licensing model across all platforms so that the data is priced consistently everywhere. This means that as of July 1, 2026 Agri-footprint 7 data libraries are no longer included in the default Professional database and additional data libraries.

Our team is currently working on the implementation of Agri-footprint 8, which is expected to be released later this year. SimaPro users who wish to utilize Agri-footprint 8 can purchase an additional data license. For more information, you can reach out to your Account Manager or sales@simapro.com.
